

Data sheet

Colibri® Electric expansion valves Type ETS 12C, ETS 24C, ETS 25C, ETS 50C, ETS 100C

ETS Colibri® is an electric stepper motor valve. The valve has been designed for precise liquid injection into evaporators for air conditioning and refrigeration applications.

The valve in-line design includes balanced cage and slider assembly operated by the direct driven motor technology. This ensures solenoid tight shut-off in both flow directions, thus providing smooth operation of the system.

The valve incorporates a powerful bi-polar motor which precisely controls flow regulation. ETS Colibri® valves are compatible with electronic control solutions from Danfoss and other manufacturers.

Applications:

Air Conditioning

- Chillers, heat pumps
- Roof top and ducted split systems
- VRF and other split systems
- Close control cooling

Refrigeration

- Cold Rooms, Food retail and Transport

Features / Benefits

Precise control of liquid injection

- Optimum utilization of the evaporator
- Increased energy efficiency and COP
- Improved overall system performance

Linear Flow characteristic

Repetitive operation of the valve at all conditions

Balanced cage design

- · Higher MOPD and MWP
- Easily fits in various application and operating conditions

Direct driven valve motor technology

 Powerful motor that guarantees precise flow control and increased energy efficiency of the system

Supports variety of refrigerants, approved for oil free applications

· Wide application scope

Fast opening/closing time of 2.5 seconds

- Quick reaction to the operating condition
- Minimizes the risk of liquid refrigerant flowing into the compressor at shut down and low pressure cut out at start up

Solenoid tight shut-off

- Prevents migration of the refrigerant during stand-still
- Reduced complexity by reducing number of components in the system

Sight glass / moisture indicator

Fast troubleshooting during system diagnostics

Compact, lightweight and in-line design

• Flexible and easy integration in any system

Bi-metal connectors

Fast and improved brazing process - no wet wrap needed

Stainless construction

· Internal and external corrosion resistant

Fully hermetic laser welded design

- Hermetic valve in accordance to EU F-gas Regulation EU 517/2014
- No external leakage which saves cost on maintenance and refrigerant loss
- Protecting the environment and climate

Manufactured according to ISO/TS16949

• Second – to – none quality and reliability

Accessories: M12 angle cable

M12 angle female connector is intended for use with a standard M12 male connector, available on stepper motor valves.

This cable is designed to offer high flexibility and small outer diameters with tensile strength. The angle way M12 cable consist of paired, twisted wires, which decreases mutual influence between signals transmitted along the cable and reduces influence of external sources of interference. The cables thus provides a higher degree of protection against lost steps compared to other cables.

Dimensions

Design and function

The ETS Colibri® in-line electronic expansion valve regulates refrigerant flow by means of an internal cage slider which moves in a linear motion. This occurs by the rotation of a spindle assembly which moves when electrical pulses are applied to the motor.

The direction of the rotation of the spindle depends on the phase relationship of the power pulses. The valve design is pressure balanced, giving identical bi-flow performance capabilities and nearly identical maximum capacities.

Operating the ETS Colibri® series requires a controller that can provide 800mA peak/ 600mA RMS current per phase in order to achieve the operational temperature and MOPD envelope of the valve.

Cable length

Depending on the type of controller or driver, there will be limitations in cable length between the controller / driver and the valve.

Both the actual cable length, the level of EMC emission on the location and the driver circuit have an impact on the actual distortion of the current to the motor. On using 3rd party longer cable, make sure that the valve receives the exact current as defined in the specification.

Flow direction

Flow direction from A to B refers the normal flow.

Sightglass for flash gas detection can only be used in normal flow direction.

Valve design

Sight glass and indicator

ETS 25C, ETS 50C and ETS 100C have integrated sight glass with moisture indicator. The presence of the sight glass provides the availability to check the physical position of the slider in the valve. It also helps to determine the flow direction of the refrigerant in the system. Insufficient sub cooling can produce flash gas which is visible through the sight glass. The moisture indicator in the sight glass indicates dry or wet state of the refrigerant by changing colour.

The colors of the grooves are only for illustration purposes

Flow curve

Partially open

Partially open

Fully closed

For R134a

- The above estimated capacities, are based on the following conditions: Evaporating temperature t_e : 5 °C / 40 °F Liquid temperature t₁: 28 °C / 82 °F

- Condensing temperature t₅: 32 °C / 90 °F

Full stroke opening in normal flow direction. Capacity is \pm 10% in full open state in reverse flow direction.

Driving Colibri® valve

ETS Colibri valves use a bipolar, 2-phase, permanent magnet stepper motor.

ETS valves can be driven using various electronic control techniques i.e: Full step excitation mode, half step excitation mode, micro stepping mode (recommended).

On selecting controller from other manufacturer than Danfoss, it is necessary to set the following correct valve data into the controller setting. The wrong settings may impair the performance of the valve.

- a. Total no. of steps
- b. Step rate
- c. Phase current
- d. Overdriving against closing position

If the controller driving the ETS Colibri valve is from another manufacturer than Danfoss or a custom design, the following points must be considered in order to overcome potential step loss. To ensure total closing of the valve, and to compensate the lost steps after a defined number of changes in opening degree the controller should have a function to overdrive the valve in the closing direction. It is recommended to overdrive the valve at appropriate intervals as specified in the specification table.

At power failure the ETS valve will remain in the actual opening position it has at the moment of power failure, unless a device in the form of a battery backup to the controller is installed.

Stepper motor switch sequence

The following table shows the full step excitation switching sequence

| | | Coi | <u>'</u> | | oil B | , |

Electrical check of stepper motor and wiring: coil A and coil B = 10Ω at 20 °C / 68 °F

Operation principle

This section explains the operation of the two phase full step excitation method in a bipolar stepper motor. Fig. 1 shows the simplified diagram of a rotor and a stator. The Full stepping operation is summarized below.

When a current in a form of a pulse flows to a given phase, that phase of the stator is excited as shown in Fig. 2.

- On exciting Phases B1 and A1 simultaneously, the permanent magnets on the rotor are moved in the intermediate position between phase B1 and phase A1
- 2. When phases A1 and B2 are excited simultaneously, the rotor is then positioned between phases A1 and B2
- 3. Next, by exciting the successive adjacent pairs of phases sequentially i.e phases B2 and A2, phases A2 and B1, and phases B1 and A1, the rotor rotates through two phase excitations
- 4. By completely reversing the cycle in the following sequence phases B1 and A1 to phases A2 and B1 to phases B2 and A2 to phases A1 and B2, the stepper motor then reverses its rotation
- 5. The stepper motor is stopped by holding the phase excitation for a specified period at the last phase of forward or reverse rotation

Two phase full step excitation

ETS Colibri valves can also be driven by micro stepping excitation method (preferred) in addition to the one explained above.

Troubleshooting

| Symptom | Possible Cause | Remedy | | | | | |
|--|--|--|--|--|--|--|--|
| | Lack of proper electrical connection | Check the connection between valve and a controller | | | | | |
| | Wrong parameter setting in controller | Check valve settings in controller i.e pre-selected valves, no. of steps, phase current, direction of valve rotation, steps per second | | | | | |
| No valve movement | Broken motor/ short circuit | Check the resistance between coil A and coil B. Resistance in each coil should be 10 ohms @20°C. Details on page 4 Replace a complete valve | | | | | |
| | Insufficient power supply to valve | Check the current/voltage supply from controller to valve | | | | | |
| | Control pulse to valve is influenced by high external electrical noise | Separate the cable from high power lines | | | | | |
| Internal leakage (due to 'Step Loss') | Longer cable length between valve and controller | Check the maximum cable length allowed between the controller and the valve For longer cable distance, use cable with bigger wire diameter Use cable filter | | | | | |
| | Accumulated backlash in valve | Controller should overdrive the valve to compensate the lost steps after a number of changes in opening degree | | | | | |
| | Insufficient power supply to the valve | Check the current/voltage supply from controller to valve Check the supply power to controller | | | | | |
| | Expansion valve too small | Check refrigeration system capacity and compare with expansion valve capacity. Replace with larger valve if necessary | | | | | |
| Insufficient capacity | Suction pressure too low Evaporator superheat too high | Check superheat performance, the settings SH min and SH max. in the super heat controller Check valve capacity Check 'total number of steps' defined in the controller Also check section 'High Superheat' | | | | | |
| | Expansion valve blocked with foreign material | Remove and examine the valve | | | | | |
| | Evaporator wholly or partly iced up | De-ice evaporator | | | | | |
| Himb armanhaat | Lack of sub-cooling | Check refrigerant Also refer to section Insufficient capacity | | | | | |
| High superheat | Controller is not setup/tuned properly | Check the controller superheat settings and sensors connected to it Tune PID parameters in the controller | | | | | |
| Flash gas | Lack of sub-cooling ahead of expansion valve | Check refrigerant for flash gas ahead of expansion valve / external subcooler If the valve is placed much higher than condenser outlet, check pressure difference | | | | | |
| - | Oversized valve selected | Limit max opening degree of the valve setting in controller Check refrigeration system capacity and compare with expansion valve capacity. Use proper valve size suitable for the system | | | | | |

All Danfoss products fulfill the requirements in REACH.

One of the obligations in REACH is to inform customers about presence of Candidate list substances if any, we hereby inform you about one substance on the candidate list: A moist indicator in the sight glass contains a paper which is impregnated with Cobalt Dichloride (CAS no: 7646-79-9) in a concentration above 0.1% w/w. Avoid skin contact with the paper - Do not inhale the dust from the paper - The paper must be disposed as hazardous waste.

Danfoss can accept no responsibility for possible errors in catalogues, brochures and other printed material. Danfoss reserves the right to alter its products without notice. This also applies to products already on order provided that such alterations can be made without subsequential changes being necessary in specifications already agreed.
